

Novel Coronavirus (2019-nCoV) Situation Report – 22

Data as reported by 11 February 2020*

HIGHLIGHTS

- No new countries reported cases of 2019-nCoV in the past 24 hours.
- An advanced team is currently in Beijing to prepare an international mission and to determine the questions the international team will want to learn more about: from characteristics of the virus to public health response China put in place to try to contain the virus. The group of international experts, with a range of specializations, will work with Chinese counterparts on increasing understanding of the outbreak to guide global response efforts. Since being notified of the outbreak on 31 December, the WHO Country Office in China, supported by the regional and international offices, has worked to support China, and indeed the world, to scale up the response. A small mission was sent to Wuhan mid-January, and the Director-General visited in January.
- Following WHO <u>best practices</u> for naming of new human infectious diseases, which were developed in consultation and collaboration with the World Organisation for Animal Health (OIE) and the Food and Agriculture Organization of the United Nations (FAO), WHO has named the disease COVID-19, short for "coronavirus disease 2019."

SITUATION IN NUMBERS total and new cases in last 24 hours

Globally

43 103 confirmed (2560 new)

China

42 708 confirmed (2484 new) 7333 severe (849 new) 1017 deaths (108 new)

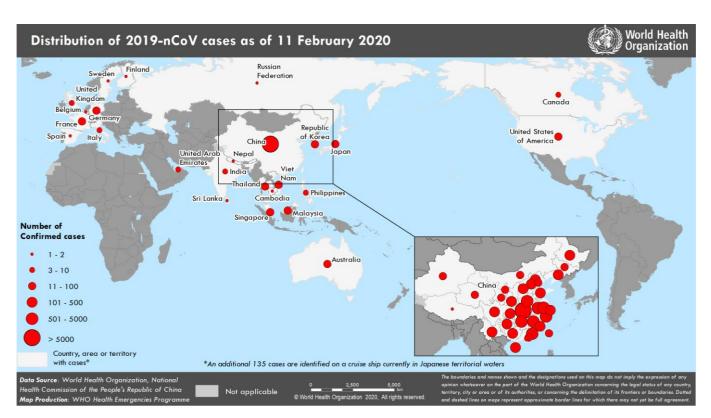

Outside of China

395 confirmed (76 new) 24 countries 1 death

WHO RISK ASSESSMENT

China Very High Regional Level High Global Level High

Figure 1. Countries, territories or areas with reported confirmed cases of 2019-nCoV, 11 February 2020

^{*}The situation report includes information provided by national authorities as of 10 AM Central European Time

TECHNICAL FOCUS: Zoonotic component of 2019-nCoV and human-animal interface

Increasing evidences demonstrate the link between the 2019-nCoV and other similar known coronaviruses (CoV) circulating in bats, and more specifically those of the Rhinolophus bat sub-species. These sub-species are abundant and widely present in Southern China, and across Asia, the Middle East, Africa and Europe. Recent studies indicate that more than 500 CoVs have been identified in bats in China. To be noted that serological studies conducted in rural population living close to bats natural habitat in caves revealed a 2.9% bat-CoV seroprevalence, demonstrating that humans exposure to bat-CoVs might be common.¹

However, the route of transmission to humans at the start of this event remains unclear. Bats are rare in markets in China but hunted and sold directly to restaurants for food.² The current most likely hypothesis is that an intermediary host animal has played a role in the transmission.

Both Chinese and external expert groups are working in trying to identify the animal source of this new virus. Identifying the animal source of the 2019-nCoV would help to ensure that there will be no further future similar outbreaks with the same virus and will also help understanding the initial spread of the disease in the Wuhan area. It would also increase our understanding of the virus and help us understand how these viruses jump from animals to humans. Thus, providing critical knowledge on how to protect us from future similar events. In this regard, strengthening food control and market hygiene activities in live food market will be essential to protect people from similar and other zoonotic diseases.

SURVEILLANCE

Table 1. Confirmed cases of 2019-nCoV acute respiratory disease reported by provinces, regions and cities in China, 11 February 2020

| Province/Region/City | Confirmed Cases | | | |
|----------------------|-----------------|--|--|--|
| Hubei | 31728 | | | |
| Guangdong | 1177 | | | |
| Zhejiang | 1117 | | | |
| Henan | 1105 | | | |
| Hunan | 912 | | | |
| Anhui | 860 | | | |
| Jiangxi | 804 | | | |
| Jiangsu | 515 | | | |
| Chongqing | 486 | | | |
| Shandong | 486 | | | |
| Sichuan | 417 | | | |
| Heilongjiang | 360 | | | |
| Beijing | 342 | | | |
| Shanghai | 302 | | | |
| Fujian | 267 | | | |
| Hebei | 239 | | | |
| Shaanxi | 219 | | | |
| Guangxi | 215 | | | |
| Yunnan | 149 | | | |
| Hainan | 142 | | | |
| Shanxi | 122 | | | |
| Guizhou | 118 | | | |
| Liaoning | 108 | | | |
| Tianjin | 96 | | | |
| Gansu | 86 | | | |
| Jilin | 81 | | | |
| Inner Mongolia | 58 | | | |
| Xinjiang | 55 | | | |
| Ningxia | 53 | | | |
| Hong Kong SAR | 42 | | | |
| Qinghai | 18 | | | |
| Taipei and environs | 18 | | | |
| Macao SAR | 10 | | | |
| Xizang | 1 | | | |
| Total | 42 708 | | | |

Table 2. Countries, territories or areas with reported confirmed 2019-nCoV cases and deaths. Data as of 11 February 2020

| WHO Region | Country/Territory/Area | Confirmed* cases (new) | Total cases with travel history to China (new) | Total cases with possible or confirmed transmission outside of China† (new) | site of transmission under | Total deaths (new) |
|---------------------------------|-------------------------------------|---------------------------|---|---|----------------------------------|-----------------------|
| Western Pacific Region | China [‡] | 42 708 (2484) | | | | 1017 (108) |

^{*}Case classifications are based on WHO case definitions for 2019-nCoV.

[†]Location of transmission is classified based on WHO analysis of available official data and may be subject to reclassification as additional data become available.

[‡]Confirmed cases in China include cases confirmed in Hong Kong SAR (42 confirmed cases, 1 death), Macao SAR (10 confirmed cases) and Taipei and environs (18 confirmed cases).

^{**}Cases identified on a cruise ship currently in Japanese territorial waters.

[§]The exposure for both cases occurred outside of Spain.

^{***}The exposure for 6 cases occurred outside of the United Kingdom.

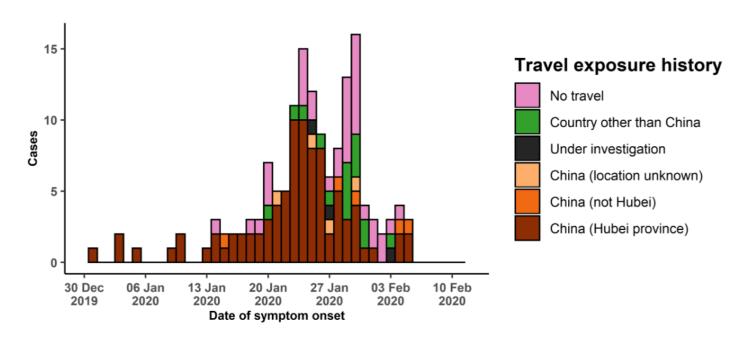

^{††}The exposure for 4 cases occurred outside of Singapore.

^{§§}The exposure for 3 cases occurred outside of Republic of Korea.

^{‡‡}The exposure for 1 case occurred outside of Malaysia.

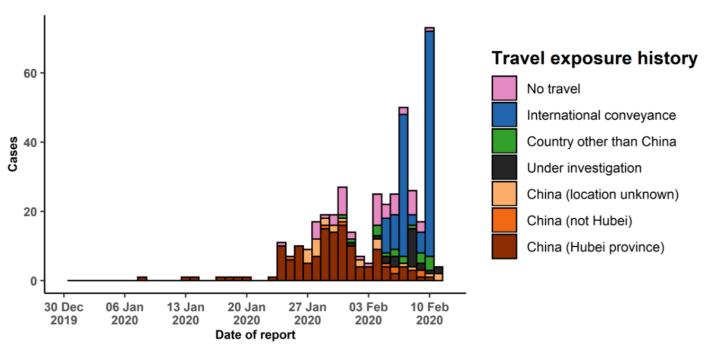

^{***}The exposure for 2 cases occurred outside of Thailand.

Figure 2: Epidemic curve of 2019-nCoV cases (n=150) identified outside of China, by date of onset of symptoms and travel history, 11 February 2020

Note for figure 2: Of the 395 cases reported outside China, 16 were detected while apparently asymptomatic. For the remaining 379 cases, information on date of onset is available only for the 150 cases presented in the epidemiologic curve.

Figure 3: Epidemic curve of 2019-nCoV cases (n=395) identified outside of China, by date of reporting and travel history, 11 February 2020

STRATEGIC OBJECTIVES

WHO's strategic objectives for this response are to:

- Limit human-to-human transmission including reducing secondary infections among close contacts and health care workers, preventing transmission amplification events, and preventing further international spread from China*;
- Identify, isolate and care for patients early, including providing optimized care for infected patients;
- Identify and reduce transmission from the animal source;
- Address crucial unknowns regarding clinical severity, extent of transmission and infection, treatment
 options, and accelerate the development of diagnostics, therapeutics and vaccines;
- Communicate critical risk and event information to all communities and counter misinformation;
- Minimize social and economic impact through multisectoral partnerships.

*This can be achieved through a combination of public health measures, such as rapid identification, diagnosis and management of the cases, identification and follow up of the contacts, infection prevention and control in health care settings, implementation of health measures for travelers, awareness-raising in the population and risk communication.

PREPAREDNESS AND RESPONSE

- To view all technical guidance documents regarding 2019-nCoV, please go to this webpage.
- WHO is working closely with International Air Transport Association (IATA) and have jointly developed a
 guidance document to provide advice to cabin crew and airport workers, based on country queries. The
 guidance can be found on the <u>IATA webpage</u>.
- WHO has developed a protocol for the investigation of early cases (the "First Few X (FFX) Cases and contact investigation protocol for 2019-novel coronavirus (2019-nCoV) infection"). The protocol is designed to gain an early understanding of the key clinical, epidemiological and virological characteristics of the first cases of 2019-nCoV infection detected in any individual country, to inform the development and updating of public health guidance to manage cases and reduce potential spread and impact of infection.
- WHO has been in regular and direct contact with Member States where cases have been reported. WHO is also informing other countries about the situation and providing support as requested.
- WHO has developed interim guidance for laboratory diagnosis, advice on the use of masks during home care and in health care settings in the context of the novel coronavirus (2019-nCoV) outbreak, clinical management, infection prevention and control in health care settings, home care for patients with suspected novel coronavirus, risk communication and community engagement and Global Surveillance for human infection with novel coronavirus (2019-nCoV).
- WHO has prepared <u>disease commodity package</u> that includes an essential list of biomedical equipment, medicines and supplies necessary to care for patients with 2019-nCoV.
- WHO has provided recommendations to reduce risk of transmission from animals to humans.
- WHO has published an <u>updated advice for international traffic in relation to the outbreak of the novel</u> <u>coronavirus 2019-nCoV</u>.
- WHO has activated of R&D blueprint to accelerate diagnostics, vaccines, and therapeutics.
- WHO has developed an <u>online course</u> to provide general introduction to emerging respiratory viruses, including novel coronaviruses.
- WHO is providing guidance on early investigations, which are critical to carry out early in an outbreak of a new virus. The data collected from the protocols can be used to refine recommendations for surveillance and case definitions, to characterize the key epidemiological transmission features of 2019-nCoV, help understand spread, severity, spectrum of disease, impact on the community and to inform operational models for implementation of

countermeasures such as case isolation, contact tracing and isolation. Several protocols are available here: https://www.who.int/emergencies/diseases/novel-coronavirus-2019/technical-guidance/early-investigations

- WHO is working with its networks of researchers and other experts to coordinate global work on surveillance, epidemiology, modelling, diagnostics, clinical care and treatment, and other ways to identify, manage the disease and limit onward transmission. WHO has issued interim guidance for countries, which are updated regularly.
- WHO is working with global expert networks and partnerships for laboratory, infection prevention and control, clinical management and mathematical modelling.

RECOMMENDATIONS AND ADVICE FOR THE PUBLIC

During previous outbreaks due to other coronavirus (Middle-East Respiratory Syndrome (MERS) and Severe Acute Respiratory Syndrome (SARS), human-to-human transmission occurred through droplets, contact and fomites, suggesting that the transmission mode of the 2019-nCoV can be similar. The basic principles to reduce the general risk of transmission of acute respiratory infections include the following:

- Avoiding close contact with people suffering from acute respiratory infections.
- Frequent hand-washing, especially after direct contact with ill people or their environment.
- Avoiding unprotected contact with farm or wild animals.
- People with symptoms of acute respiratory infection should practice cough etiquette (maintain distance, cover coughs and sneezes with disposable tissues or clothing, and wash hands).
- Within health care facilities, enhance standard infection prevention and control practices in hospitals, especially in emergency departments.

WHO does not recommend any specific health measures for travellers. In case of symptoms suggestive of respiratory illness either during or after travel, travellers are encouraged to seek medical attention and share their travel history with their health care provider.
